EASY

1. OddOccurrencesInArray

Find value that occurs in odd number of elements.

score: 100 of 100

Task description

A non-empty zero-indexed array A consisting of N integers is given. The array contains an odd number of elements, and each element of the array can be paired with another element that has the same value, except for one element that is left unpaired.

For example, in array A such that:

```
A[0] = 9  A[1] = 3  A[2] = 9
A[3] = 3  A[4] = 9  A[5] = 7
A[6] = 9
```

- the elements at indexes 0 and 2 have value 9,
- the elements at indexes 1 and 3 have value 3,
- the elements at indexes 4 and 6 have value 9,
- the element at index 5 has value 7 and is unpaired.

Write a function:

```
    class Solution { public int solution(int[] A); }
```

that, given an array A consisting of N integers fulfilling the above conditions, returns the value of the unpaired element.

For example, given array A such that:

```
A[0] = 9  A[1] = 3  A[2] = 9
A[3] = 3  A[4] = 9  A[5] = 7
A[6] = 9
```

Solution

Programming language used: Java

Total time used: 2 minutes

Effective time used: 2 minutes

Notes: *not defined yet*

Task timeline

15:39:46 15:40:49

Code: 15:40:49 UTC, java, final, score: **100**

show code in pop-up

```
import java.util.Map;
import java.util.Optional;
import java.util.function.Function;
import java.util.stream.Collectors;
import java.util.stream.IntStream;

```

the function should return 7, as explained in the example above.

Assume that:

- N is an odd integer within the range [1..1,000,000];
- each element of array A is an integer within the range [1..1,000,000,000];
- all but one of the values in A occur an even number of times.

Complexity:

- expected worst-case time complexity is O(N);
- expected worst-case space complexity is O(1), beyond input storage (not counting the storage required for input arguments).

Elements of input arrays can be modified.

```java
public class Solution {

    public int solution(int[] A) {
        Optional<Integer> unMatched = IntStream.of(A)
                .boxed()
                .collect(Collectors.groupingBy(Functio
                .entrySet()
                .stream()
                .filter(value -> value.getValue() % 2 =
                .map(Map.Entry::getKey)
                .findFirst();

        return unMatched.get();
    }
}
```

Analysis summary

The solution obtained perfect score.

Analysis

?

Detected time complexity:
O(N)
